

# **PSYCH.221 Project Presentation**

## **HDR Image Encoder for Brightside Display**

**Sewoong Oh**

**March 16, 2007**

# Outline

---

- **Object**

HDR image encoding

- **Background**

Image processing pipeline : HDR Image Capture  $\Rightarrow$  Store  $\Rightarrow$  Display

- **Implementation**

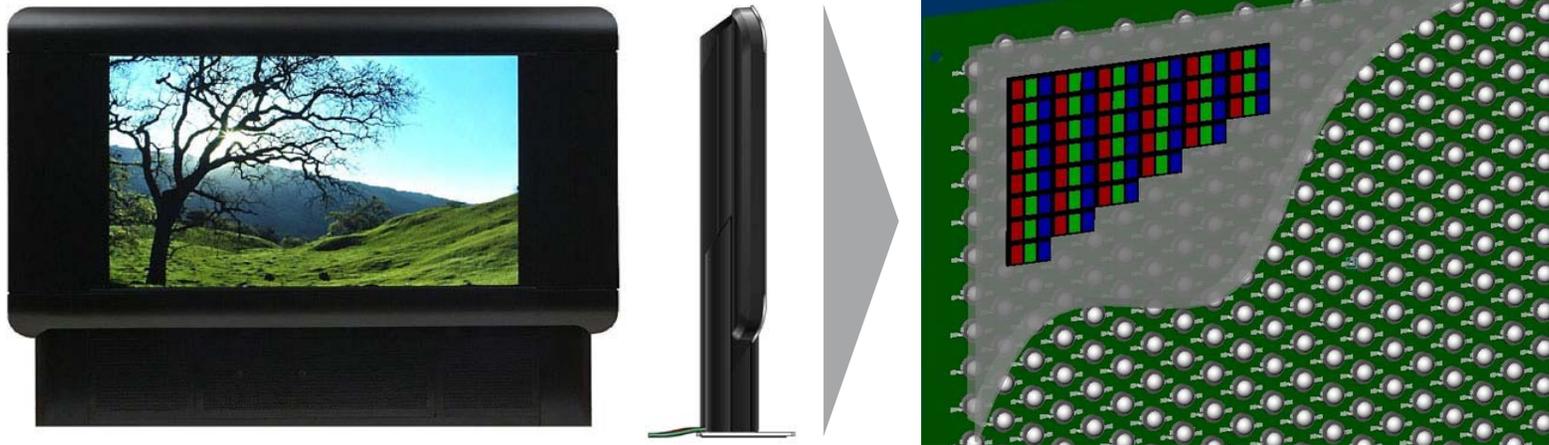

HDR Image Encoder

Improvements in solving optimization problem

- **Results**

Visual comparison Brightside Display and Sharp Aquos Display

# Object

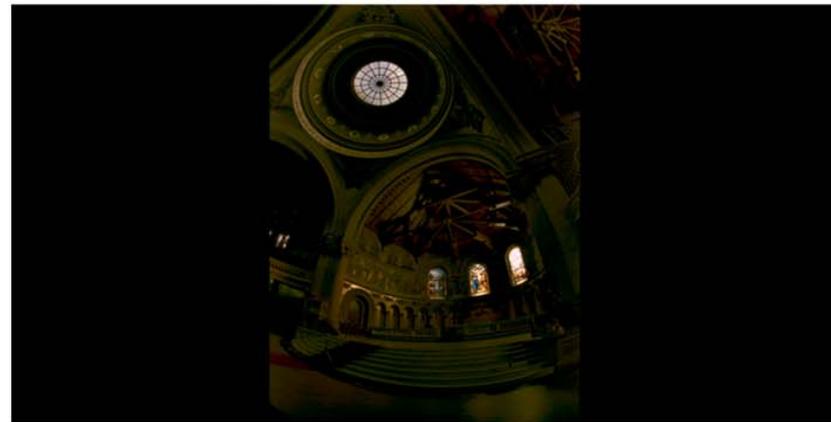

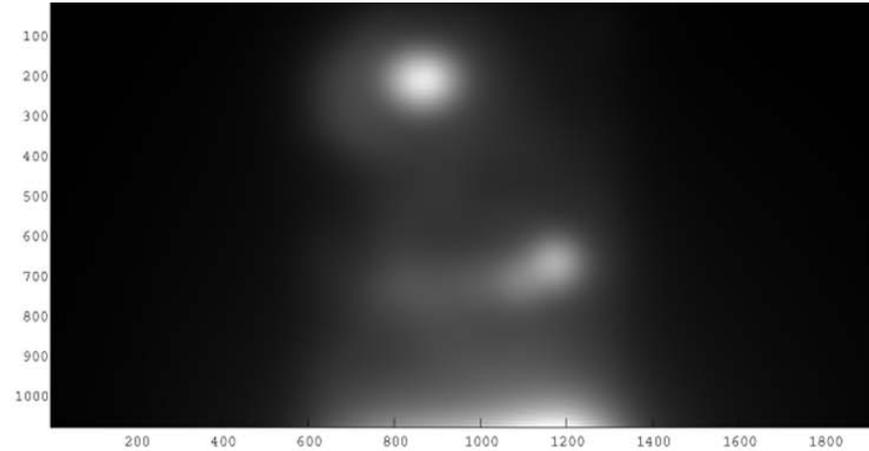

- Brightside has 2 modulation channels
  - Programmable LED array backlight  $\Rightarrow$  High Dynamic Range
  - RGBcolor channel LCD front panel

	<b>Dynamic Range(in <math>cd/m^2</math>)</b>
Brightside Display	200,000:1
LC Display	1,000:1

# Object

---

Goal : Separate input HDR image into two images(LED channel and LCD channel) s.t. when displayed on brightside, it represents the original image accurately

# Background

---

**HDR Image Capture**  $\Rightarrow$  Store  $\Rightarrow$  Display

- Scene dynamic range exceeds 100,000:1

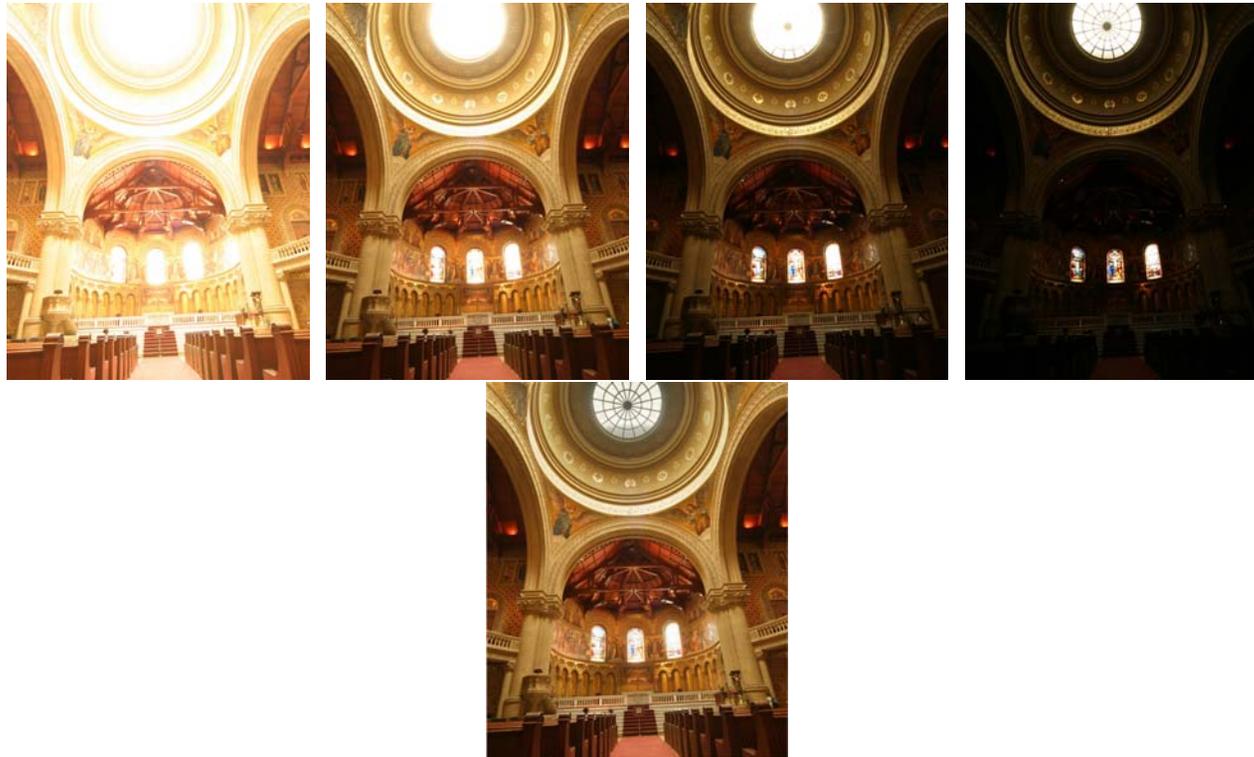

Figure 1: Memorial Church under various exposures (from PSY221 project 2006 by Tina Dong, Sufeng Li, and Michael Lin [10])

# Background

---

HDR Image Capture  $\Rightarrow$  **Store**  $\Rightarrow$  Display

Format	Encoding	bits/pixel	Dynamic Range	Relative Step
HDR	RGBE	32	76 orders	1.0%
	XYZE	32	76 orders	1.0%
TIFF	IEEE RGB	96	79 orders	0.000003%
	LogLuv24	24	4.8 orders	1.1%
	LogLuv32	32	38 orders	0.3%
EXR	Half RGB	48	10.7 orders	0.1%

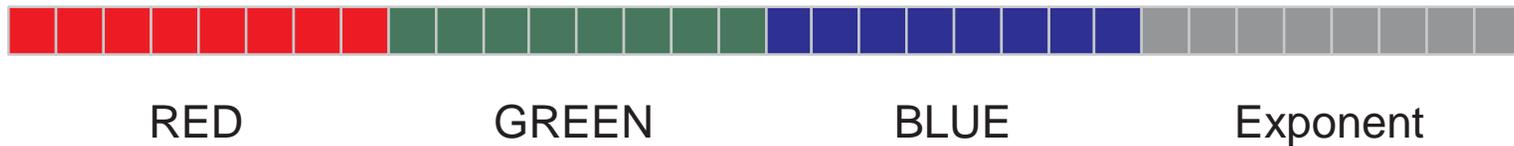

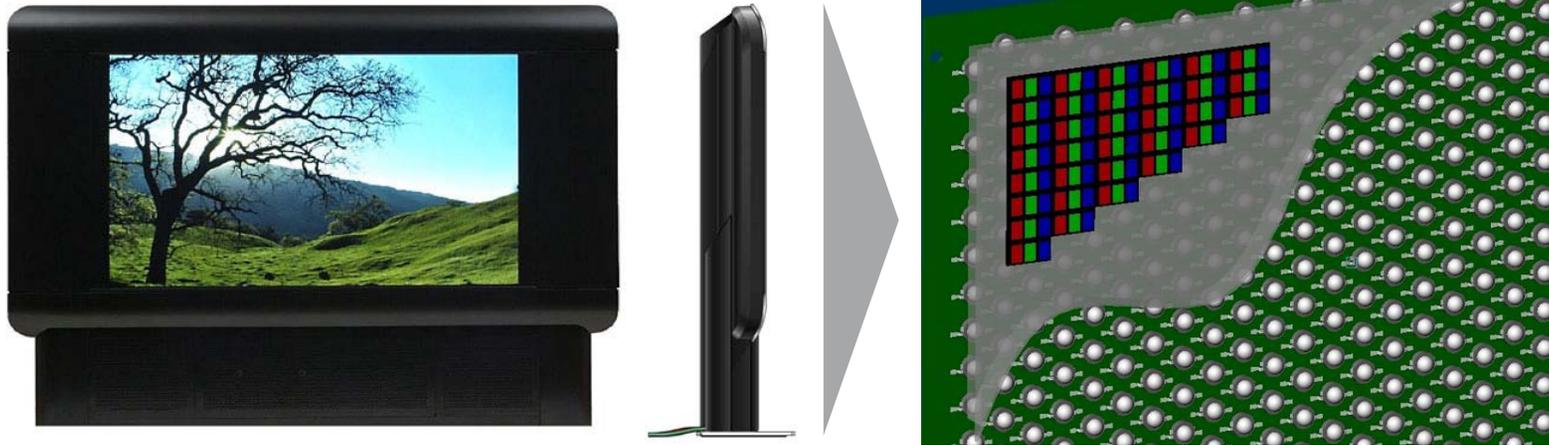

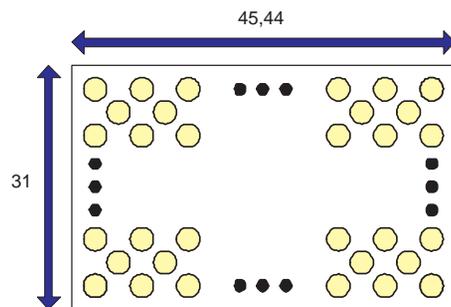

Figure 2: Bit breakdown for the 32-bit/pixel RGBE encoding

# Background

HDR Image Capture  $\Rightarrow$  Store  $\Rightarrow$  **Display**

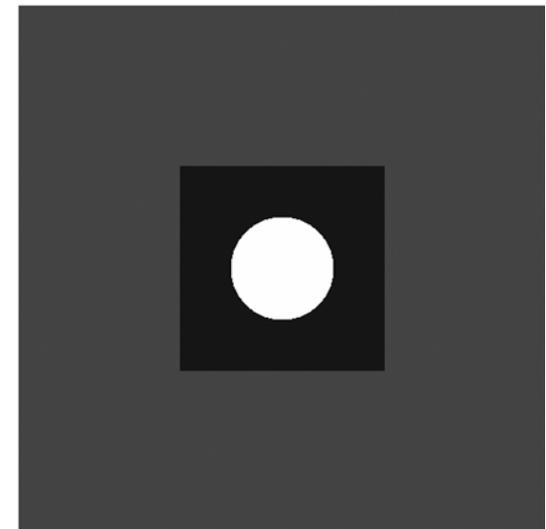

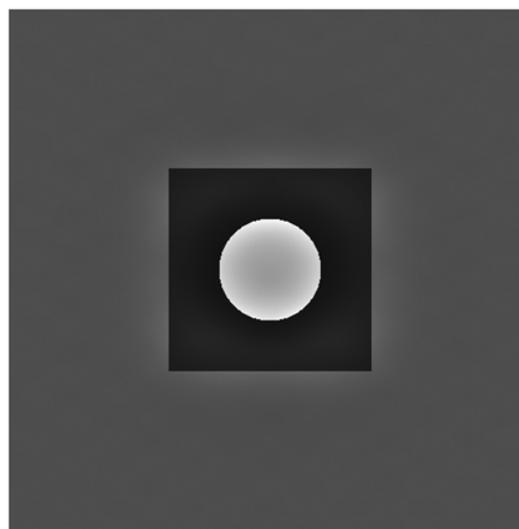

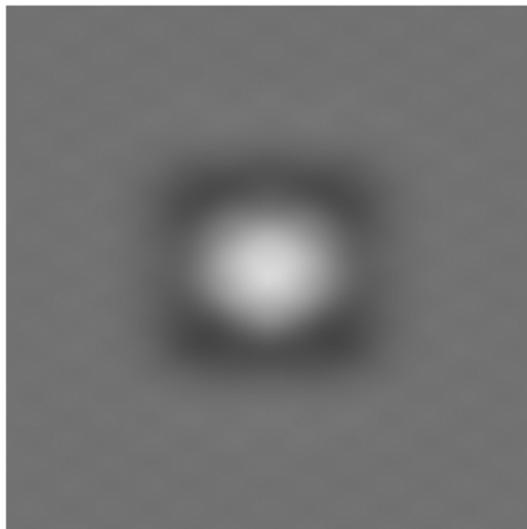

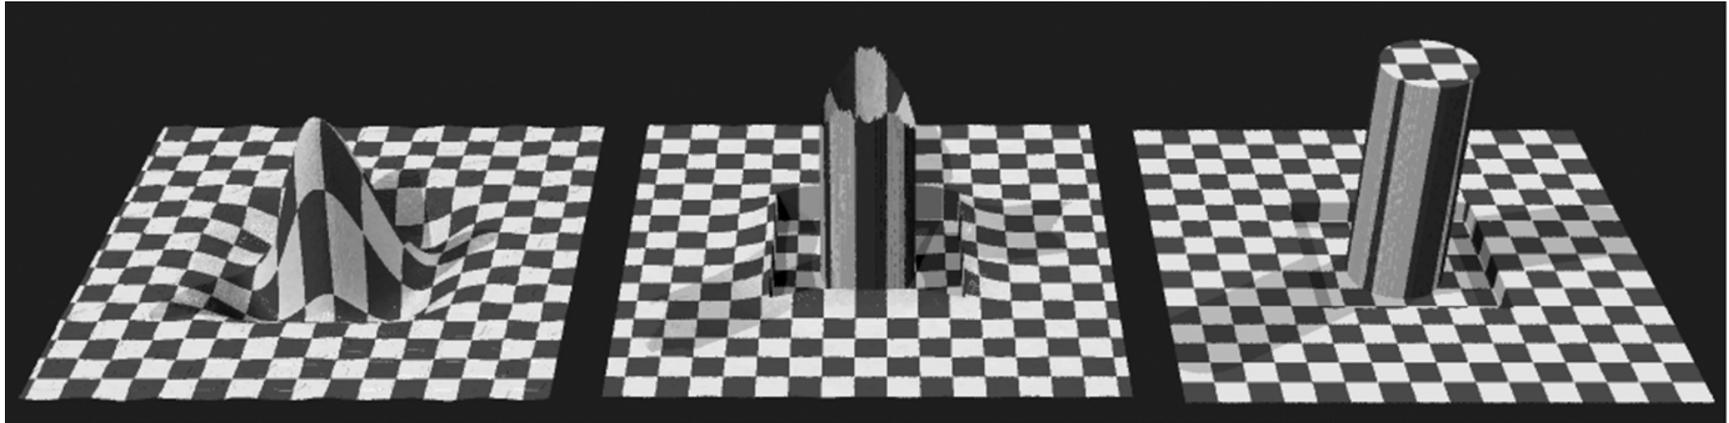

- LED :  $31 \times (44,45)$
- LCD :  $1080 \times 1920$

# Conclusion

---

- Conclusion : LDR tone mapped image "looks better". But, HDR image reproduces the original scene more accurately.

- **Brightness**

Tone mapped image is brighter, especially in the dark regions. In the real scene those dark regions may not be visible to human eye, so in that sense, HDR image reproduces the real scene more accurately(left figure). However, when we recollect the image we know, we remember all the details, including those dark regions. Hence, we're more attracted to the tone mapped image, which represents the image in our memory(right figure).

- **Color**

Colors seem to be more clear in the tone mapped image, and colors seem to be saturated in HDR image. We are not sure which one represents the original color more accurately. For the same reason as before, our memory remembers colors to be somewhat stronger, and people like what they remember. However, we need more experiments on scene HDR images to confirm which algorithm or display is more accurate in reproducing the original color.

# Suggestions

---

- Optimization problem for finding ideal backlight LED level.
- Color saturation.
- Tone mapping.

# Ideas for finding ideal LED levels

---

## Problem

$$\begin{aligned} & \text{minimize} \quad |\underline{d} - \underline{A} * \underline{x}|^2 \\ & \text{subject to} \quad 0 \leq \underline{x} \leq 1 \end{aligned}$$

- Method 1. Using CVX tools to directly solve the constrained least squares problem.[9]
- Method 2. Solving relaxed least squares with no constraints
- Method 3. Solving relaxed least squares with no constraints, and truncating all the solutions outside of the feasible set.
- Method 4. Using the original method of anti-crosstalk filtering.

# Results

---
